

Commands:

1)cd

Options:

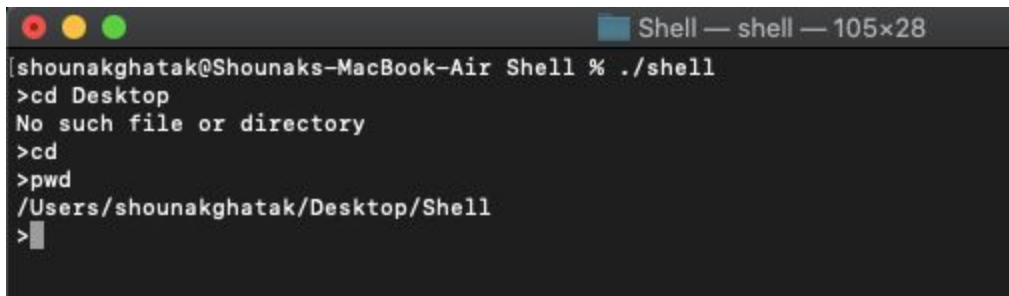

- 1) **cd ..**-Results in going one step backwards in the hierarchy
- 2) **cd ~**-Resets into the home directory

```
Shell — shell — 105x28
[shounakghatak@Shounaks-MacBook-Air Shell % ./shell
>pwd
/Users/shounakghatak/Desktop/Shell
>cd ..
>pwd
/Users/shounakghatak/Desktop
>cd ~
>pwd
/Users/shounakghatak
>
```

cd ~ resets to /Users/shounakghatak for this shell.

chdir func in <unistd.h> header file used for implementing.

```
Shell — shell — 105x28
[shounakghatak@Shounaks-MacBook-Air Shell % ./shell
>cd Desktop
No such file or directory
>cd
>pwd
/Users/shounakghatak/Desktop/Shell
>
```

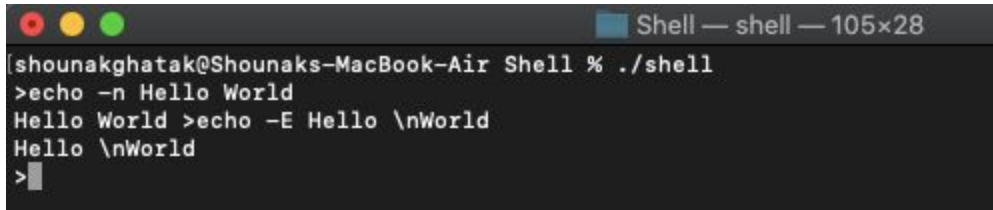

Corner cases:

- 1)Error is handled and appropriate error message displayed in case of **faulty addresses**.
- 2)When no arguments are passed to the cd program it doesn't crash and the working directory remains the same.(prevents segmentation fault).

2)echo

Options:

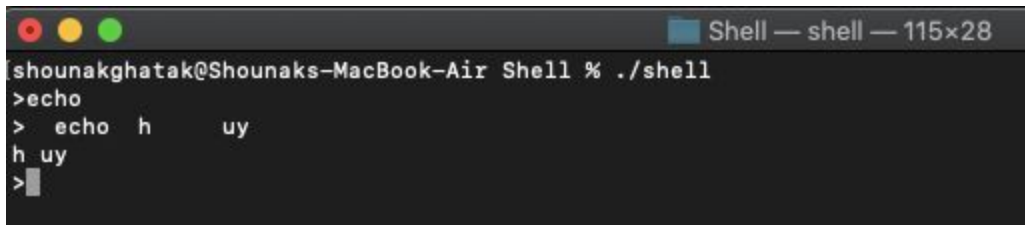

- 1) **echo -n** Prompt appears on the same line as the output is printed.
- 2) **echo -E** Format specifiers are not identified.

A terminal window titled "Shell — shell — 105x28" showing a user named shounakghatak@Shounaks-MacBook-Air. The user runs './shell' and then two echo commands. The first is '>echo -n Hello World', which prints 'Hello World' on the same line as the prompt. The second is '>echo -E Hello \nWorld', which prints 'Hello \nWorld' on two lines. The prompt is '>'.

Implemented by parsing and printf.

Corner cases:

- 1)When no arguments are passed to the echo program it doesn't crash and the working directory remains the same(prevents segmentation fault).
- 2)Extra Spaces are not counted and handled.

A terminal window titled "Shell — shell — 115x28" showing a user named shounakghatak@Shounaks-MacBook-Air. The user runs './shell' and then two echo commands. The first is '>echo', which prints an empty line. The second is '> echo h uy', which prints 'h uy' on two lines. The prompt is '>'.

3)history

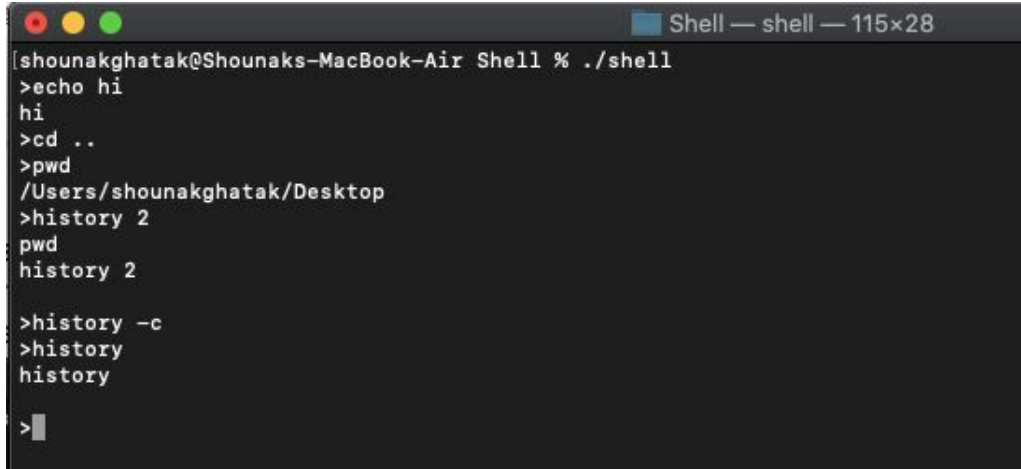

Options:

- 1)**history -c** clears the history file.
- 2)**history [number]** prints the latest [number] of commands.

Corner cases:

- 1)Does not crash for the case history 1.
- 2)Handles the case when the history file is cleared and history is called immediately after.
- 3)Does not crash for false flags.

Implemented by maintaining a text file which keeps track of all the commands(new text file each time shell is run).

```
Shell — shell — 115x28
shounakghatak@Shounaks-MacBook-Air Shell % ./shell
>echo hi
hi
>cd ..
>pwd
/Users/shounakghatak/Desktop
>history 2
pwd
history 2

>history -c
>history
history
>
```

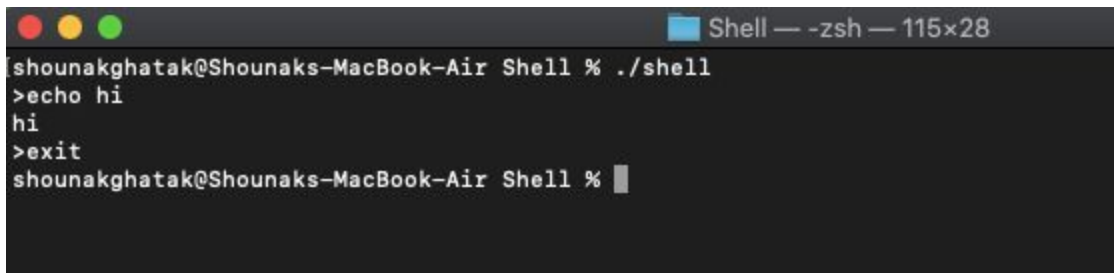

4)pwd

Just prints the current working directory.(refer cd screenshots).Implemented by using the `getcwd()` command from `<unistd.h>` header file.

There are no corner cases and options couldn't be found which were in the scope for this command.

5)exit

Exits the program.

```
Shell — -zsh — 115x28
shounakghatak@Shounaks-MacBook-Air Shell % ./shell
>echo hi
hi
>exit
shounakghatak@Shounaks-MacBook-Air Shell %
```

6)date

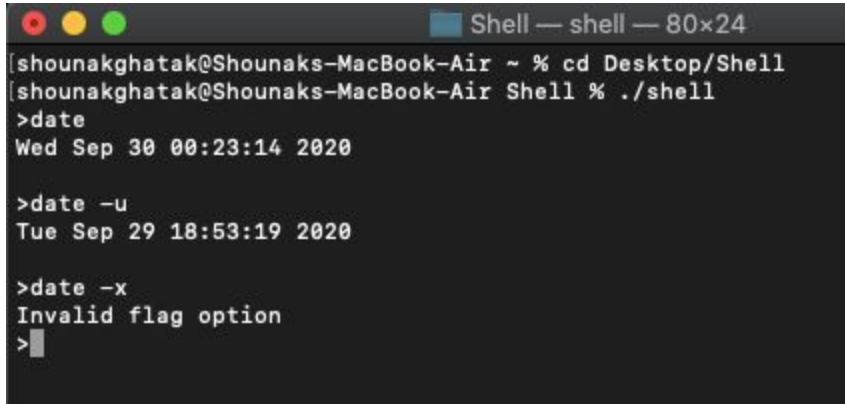

Options:

- 1)**date -u**:Displays date in universal time.
- 2)**date --debug** Displays the date as an annotation.

Implemented using `execl()` system call from child process and `time.h` header file.

Corner cases:

- 1)Handles invalid flag options.
- 2)Takes care of extra spaces between the command and the flag.

```
Shell — shell — 80x24
[shounakghatak@Shounaks-MacBook-Air ~ % cd Desktop/Shell
[shounakghatak@Shounaks-MacBook-Air Shell % ./shell
>date
Wed Sep 30 00:23:14 2020

>date -u
Tue Sep 29 18:53:19 2020

>date -x
Invalid flag option
>
```

7)ls**Options:**

- 1)**ls -a**-Displays hidden files
- 2) **ls -i** Displays INO numbers of files

Implemented using dirent.h header file and execl system call.

Corner cases:

- 1)Handles invalid flags.
- 2) Handles invalid addresses.

Notes:

- 1)All addresses are assumed to be relative to the current working directory.
- 2)Addresses if any should start with “\”.

Screenshots of all cases on the next pages.

```
>ls -a

```
>ls -x
Invalid argument
>ls /Desktop/Desktop
No such file or directory
>█
```

8) cat

Options:

- 1) **cat -n** Prints file with row numbers.
- 2) **cat -e** Prints "\$" at the end of each line.

Implemented using file pointers and then parsing the file.

Corner cases:

- 1) Handles invalid flags.
- 2) Handles invalid addresses.

Notes:

- 1) All addresses are assumed to be relative to the current working directory.
- 2) Addresses if any should **not** start with "\".

Here is a sample of a file t.txt in the Desktop.

```
shounakghatak@Shounaks-MacBook-Air Shell % ./shell
>cd ..
>cat t.txt
echo hi1
echo hi 23

>cat -n t.txt
1 echo hi1
2 echo hi 23

>cat -e t.txt
echo hi1$
echo hi 23$

>cat -x t.txt
No such file or directory
>cat
Missing file name
>█
```

```
echo hi1
echo hi 23
```

9)mkdir

Options:

- 1)**mkdir -m777**-Makes a directory with full read,write & execute permissions for all.
- 2)**mkdir -v** Creates a directory in the current location.

Implemented using mkdir() in <sys/stat.h> header file and execl system call.

Corner cases:

- 1)Handles the case when there is no directory name given .
- 2) Handles invalid addresses.

Notes:

- 1)All addresses are assumed to be relative to the current working directory.
- 2)Addresses if any should **not** start with “\”.
- 3) Space separated names are not considered for name.

```
>mkdir a
>mkdir -v a
File exists
>mkdir -v ab
>mkdir -m777 abc
>mkdir -m789 abcd
>mkdir
Missing file name
>
```

10)rm

Options:

- 1)**rm -i**-Asks for permission before deletion
- 2)**rm -f** Removes forcefully the file.(does not show error messages).

Implemented using remove() function in <stdio.h> header file.

Corner cases:

- 1) Handles the case when there is no directory name given .
- 2) Handles invalid addresses.

Notes:

- 1) All addresses are assumed to be relative to the current working directory.
- 2) Addresses if any should **not** start with “\”.

```
/Users/shounakghatak/Desktop  
>rm -i a  
Remove file?  
yes  
>rm -f ab  
>rm  
Missing file name  
>|
```

abc

-m789
